

Nassim Haramein to Address One Heart Conference

Physicist, Nassim Haramein who will be the keynote speaker at the [One Heart Annual Conference](#), June 13-14th, may have solved the greatest mystery of the universe. His published and peer reviewed unified field theory claims to have solved the unification between Einstein's field equations and quantum physics...the Holy Grail of physics. In doing so, he has discovered an infinitely dense, conscious energy field in the vacuum underlying, and in a feedback loop, with all of physical reality. In other words, he claims to have found the scientific explanation of the spiritual realm although he contends it is all one place! Like vortexes in a lake, he believes matter is a dynamic of this energy density, not something apart from it.

His theory, called the *Haramein Rauscher Solution*, explains the dynamics of the smallest subatomic particle to the entire visible universe and beyond. With a shift in our basic understanding of dimensions, and by pointing out inconsistencies in our fundamental concepts in physics, and the alterations necessary to correct them, he comes to a whole new paradigm of physics. Unlike the current understanding, his theory is not based on finding the smallest particle or building block of matter. Instead, Haramein believes all matter is three dimensional and thus can be divided to infinity using the geometry of the six pointed star and ultimately a 64 tetrahedral grid.

According to Haramein space or the vacuum is filled with an infinite amount of energy and not at all empty as the words imply. In fact, he demonstrates, by using the known measure of the Planck's length, that the entire visible universe could be compacted to fit into one cubic centimeter of this "vacuum" energy. With all matter going to infinite density which is the definition of a black hole, he goes on to create a model of how the universe creates boundary conditions around infinities to create matter. He found by using geometric fractals that are in perfect equilibrium, boundaries and infinities are indeed compatible.

According to Haramein's theory, this means there are two sides to the universe; the expansive side which we call reality, for which the current model is an expanding balloon with pennies on it representing galaxies, and a contracting side going to infinite density or black hole, connected by the event horizon which is the rim of the black/white hole.

So what does this mean for you and your daily life? If it's true...everything! If all matter is infinite, it means you are infinite. In fact everything, according to this theory is just a different sized black hole including the sun, planets, and you. Just as with a super nova, when a star explodes, it is said to have turned into a black hole. Hamein says no, the black hole was always there and when a sun sheds its boundary condition, you can see the black hole that was always at the center.

The infinity within the black hole is where all information, past, present and future exist all at once, much like a hologram, and is in a constant feedback loop of communication with the expansive side which you and I see as physical matter. Perhaps when we were told the Kingdom of God is within, it was this dynamic that was being described.

This is not just some wild unsubstantiated theory. Just recently, Hamein and his team published the math that proves there is a black hole at the center of all protons and is in fact the dynamic that causes gravity and the spin of all things. Unlike current mainstream theories that hypothesize a host of yet to be discovered particles needed to match their theories, this theory is complete, solves the non-local behavior of subatomic particles, and solves the unification problem which quantum physics created in the first place. With this discovery, he believes we can do away with the theorized strong and weak forces and claims there are really only two forces in the universe; electromagnetism which is what we see as the visible universe and gravity which is the force that takes all matter to infinite density.

In conducting his research that has been a life-long process beginning with his early childhood, Hamein found what he believes are codes in many of the symbols imbedded in religions around the world. He found that symbols like the flower of life, the six pointed star, the I Ching's 64 grid of reality, the Kabbalistic Tree of Life, and the Yin and Yang sign to name a few relate specifically to his theory of the dynamics of spacetime .

Our scientists know that we are missing about 96 percent of the matter needed to explain the expansion rate of the universe that we observe. They don't know what it is, as they can't see or measure it, so they named it "dark matter" and "dark energy" and believe it is some sort of as yet undiscovered particle." That means our current understanding of the universe is based on just 4 percent of what we know is out there. That's not a very good model. In fact it has been this practice utilized by our scientific community to create

fictional particles to explain their observations and to make their math work that has kept us from a more accurate description of fundamental forces of creation.

With an accurate model of how the universe works, we will open up a whole new level of technology for mankind, as profound as when we discovered fire or the wheel. It is the anti-gravity technology that is needed to travel the stars. With this model of the universe, mankind will have access to unlimited resources, a fundamental understanding of the nature of creation and how we as individuals interact with the infinite consciousness to create our realities.

I met Nassim Hamein 4 years ago having conducted a 15 year self study of quantum physics. I was intrigued that the observations at the subatomic level seemed to substantiate many spiritual beliefs. I wanted to know how it worked. After hearing Hamein's presentation, I knew I need not look any further as his model was far more logical, observable in nature, and appears to be encoded in the world's religions as the explanation of creation.

For me, his theory answered the big questions of life; why does life exists, why do I personally exist, is there a consciousness out there larger than my own? I found this information so profound that I trained with Hamein to become one of his "Emissaries" who present his theory to the public. This knowledge has been a real gift for me for it is a rational, scientific explanation of what I intuited to be real, but that mainstream culture dismisses as metaphysical or supernatural.

In short, Nassim Hamein's work changed my life in a most profound and fundamental way for it provides the scientific explanation of creation. What could be more fascinating than that?
